

CloakRFQ Receipts

Private invoice financing where every party sees only its slice of the deal.

For suppliers who need cash before their invoices come due, and the factors, credit funds, and trade-finance desks that compete to provide it. Now live on Canton DevNet: every step is a real Daml transaction.

THE PROBLEM

To get a quote, you overshare

01

**Sellers broadcast
confidential debtor files
to every funder they ask.**

02

**Funders can see who
else is bidding, and often
the competing bids.**

03

**Platforms and brokers in
the middle see
everything, by default.**

Receivables finance already prices on private, bilateral terms. Price competition and privacy pull against each other, and on a shared ledger, oversharing is the path of least resistance.

THE IDEA

A blind RFQ, scoped per party

SELLER

Publishes a **Blind RFQ**: attestations and economics, not raw debtor files.

FUNDERS

Submit **Private Quotes** only the seller can read, never each other, with **funds committed behind every quote** (a CIP-56 allocation): no bidding what you can't pay.

EVERYONE

Compliance, risk, coordinator and auditor each get their **own scoped view**.

Same RFQ, a different authorized view for every party, enforced on-ledger by **Daml** contract visibility, not filtered in a UI.

Selective disclosure: who sees what

Party	Sees	Withheld
Seller	✓ Receivable, full Seller Quote View, selection & settlement	⚠ Funder balances & funding sources; identities pre-settlement
Funder	✓ Own RFQ Disclosure Package, own Private Quote & outcome	⚠ Competing quotes; other funders; the Quote Book
Compliance	✓ Eligibility data, its attestations, Proof-of-Funds Gate status	⚠ Quote prices & commercial terms; raw underwriting
Risk Assessor	✓ Debtor & receivable risk data needed to attest	⚠ Prices & terms; eligibility decisions; out-of-scope identities
Coordinator	✓ Workflow status, deadlines, party routing	⚠ Private Quote contents, prices & terms
Auditor / Regulator	✓ Scoped Compliance Receipt: statuses, references, outcome	⚠ Full RFQ, Quote Book, raw evidence, unselected funders
Outsider	✓ Opaque archived contracts only	⚠ Everything substantive: what, who, how much

THE ORIGINAL IDEA

Disclosure is part of the quote

Four Private Quotes on a \$480,000 receivable. The highest Net Purchase Price doesn't win:

BEST COMPLIANT

LC-3 · Lumen Capital

\$465,200

85% advance · Non-recourse

Discloses: attestations only

Lowest headline · PoF passed

HF-9 · Harbour

\$466,800

88% advance · Negotiable recourse

Discloses: debtor identity

PoF passed

VC-7 · Vanta Credit

\$468,000

90% advance · Recourse

Discloses: identity + payment history

PoF passed

0X-2 · Onyx

~~**\$470,000**~~

92% advance · Recourse

Discloses: full file + audited accounts

Highest headline · excluded at PoF Gate

Recourse, settlement timing, debtor notification and required disclosure are priced into every quote, so the top sticker price loses to a compliant one.

How the RFQ moves between parties

Quotes are **binding** within their validity window; the fallback queue is **seller-controlled**, ordered by selection criteria, never auto-sorted by headline price.

BUILT & RUNNING

Live on Canton DevNet

Not a mock-up: selective disclosure is what the ledger returns to each party.

LEDGER

The Daml model **enforces the product rules**: no RFQ without Compliance & Risk attestations, no quote without funds committed behind it, no settlement unless payment and Receivable move together.

APP

A role-switcher workspace a first-time user can drive: flip between the seven parties, an in-UI glossary explains every term, and it works on mobile. Every click is a real Daml transaction, **live-backed** via the JSON Ledger API.

VERIFY

Runs against **Canton DevNet** with zero setup: one page load allocates a self-service session with its own fresh party set, and every transaction links to the **Lighthouse explorer** for independent verification.

✓ PHASE 1 Origination & eligibility

✓ PHASE 2 Allocation-backed quotes

✓ PHASE 3 Settlement + failure path

Every decision is written down: 12 ADRs and per-phase design notes ship in the repo.

No operator sees the whole book

- A public ledger exposes every quote; a private marketplace means trusting an **operator who sees everything**.
- **Canton** gives each party its own ledger view, so competitors and counterparties transact with no all-seeing middleman.
- Disclosure is a **ledger permission**, so the compliance trail is real and selective, not reconstructed by a platform.

WHAT THIS DEMO IS, AND ISN'T

Settlement pays with a non-production **Demo Settlement Asset** through the CIP-56 token workflow.

Proof-of-Funds is a committed **CIP-56 allocation**: bid-eligibility evidence, not payment finality, a funds lock, or escrow.

No production custody, payments, or legal receivables assignment.
