

CloakRFQ Receipts

Private invoice financing where every party sees only its slice of the deal.

For suppliers who need cash before their invoices come due, and the factors, credit funds, and trade-finance desks that compete to provide it. Now live on Canton DevNet: every step is a real Daml transaction.

THE PROBLEM

To get a quote, you overshare

01

Sellers broadcast confidential debtor files to every funder they ask.

02

Funders can see who else is bidding, and often the competing bids.

03

Platforms and brokers in the middle see everything, by default.

Receivables finance already prices on private, bilateral terms. Price competition and privacy pull against each other, and on a shared ledger, oversharing is the path of least resistance.

THE IDEA

A blind-RFQ pattern, scoped per party

SELLER

Registers a represented Receivable, gathers scoped attestations, then creates **one private request per invited Funder**.

FUNDERS

Submit **Private Quotes** only the Seller can read, backed by a **committed CIP-56 demo allocation** matching the quote.

EVERYONE

Compliance, Risk, Coordinator, Auditor and Outsider each receive only their **implemented disclosure scope**.

Same RFQ, a different authorized view for every party, enforced on-ledger by [Daml](#) contract visibility, not filtered in a UI.

Selective disclosure: who sees what

Party	Sees	Withheld
Seller	✓ Receivable, attestations, eligible Private Quotes & settlement	⚠ Funder balances and unrelated funding sources
Funder	✓ Own RFQ Disclosure Package, own Private Quote & outcome	⚠ Competing quotes; other funders; the Quote Book
Compliance	✓ Compliance disclosure and the attestation/certificate it authors	⚠ Risk tier, Funder identities, requests and quotes
Risk Assessor	✓ Receivable terms needed to assign the certified risk tier	⚠ Compliance result, Funder identities, requests and quotes
Coordinator	✓ Off-ledger workflow summary only	⚠ Private Quote contents, prices & terms
Auditor	✓ Nothing before settlement; afterward, scoped sale evidence	⚠ Origination, RFQ requests, Quote Book, losing Funders
Outsider	✓ Nothing	⚠ Everything: not a stakeholder on any workflow contract

THE ORIGINAL IDEA

Private competition without an all-seeing operator

Three funding-backed Private Quotes on a \$480,000 Receivable. The Seller compares real commercial trade-offs:

ELIGIBLE

Funder A · Lumen

\$465,000

Non-recourse

Debtor notification: not required

Committed allocation · valid quote

Funder B · Harbour

\$470,000

With recourse

Debtor notification: required

Committed allocation · valid quote

Funder C · Vanta

\$468,500

Non-recourse

Debtor notification: required

Committed allocation · valid quote

Net Purchase Price is not the only decision. Recourse, Debtor-notification requirements and quote validity shape the Seller's choice, while each Funder remains blind to competitors.

How the RFQ moves between parties

Quotes remain **binding** within their validity window. After a failed settlement, the Seller can retry or choose another still-valid Quote; no on-ledger ranking is implied.

BUILT & RUNNING

Live on Canton DevNet

Not a mock-up: selective disclosure is what the ledger returns to each party.

LEDGER

The Daml model **enforces product rules**: certificate-backed requests, deadline and quote validation, committed allocation matching, coordinated payment and transfer initiation, and rollback on failure.

APP

A role-switcher workspace a first-time user can drive: flip between **seven business views**, use the in-UI glossary, and verify the same RFQ on mobile. Every action is live-backed through the Canton JSON Ledger API.

VERIFY

Runs against **Canton DevNet** with zero setup: one page load allocates a self-service session with its own fresh party set, and every transaction links to the **Lighthouse explorer** for independent verification.

✓ PHASE 1 Origination & eligibility

✓ PHASE 2 Allocation-backed quotes

✓ PHASE 3 Settlement + failure path

Every decision is written down: 12 ADRs and per-phase design notes ship in the repo.

No marketplace operator needs the whole book

- A public ledger exposes every quote; a private marketplace means trusting an **operator who sees everything**.
- **Canton** gives each party its own ledger view, so competitors and counterparties transact with no all-seeing middleman.
- Disclosure is a **ledger authorization rule**, so scoped settlement evidence is not reconstructed by an all-seeing application database.

WHAT THIS DEMO IS, AND ISN'T

The demo settlement factory settles the quoted payment leg and initiates a pending Receivable transfer; the winning Funder accepts ownership afterward.

Quote funding uses a committed **CIP-56-compatible demo allocation**: scoped funding evidence, not production custody, bank settlement, payment finality, or escrow.

No production custody, payments, or legal receivables assignment.
